Description: Intel Visual Fortran Analyzer allows developers to make the most of Intel Visual Fortran Debugger capabilities and support Visual Studio. A: I have been using it for years now and find it to be a very useful tool. I just happened to come across it yesterday: The InstallShield doesn't have a wizard to help you with the installation of Intel Inspector XE. It's kind of hidden, so you have to go to and do it manually. Another option is to use the Uninstall button that appears at the bottom right of the screen after you install Intel Inspector XE. package pflag import "strconv" // -- float32 Value type float32Value float32 func newFloat32Value(val float32, p \*float32) \*float32Value { \*p = val return (\*float32Value)(p) } func (f \*float32Value) Set(s string) error { v, err := strconv.ParseFloat(s, 32) \*f = float32Value(v) return err } func (f \*float32Value) Type() string { return "float32" } func (f \*float32Value) String() string { return strconv.FormatFloat(float64(\*f), 'g', -1, 32) } func float32Conv(sval string) (interface{}, error) { v, err := strconv.ParseFloat(sval, 32) if err != nil { return 0, err } return float32(v), nil } // GetFloat32 return the float32 value of a flag with the given name func (f \*FlagSet) GetFloat32(name string) (float32, error) { val, err := f.getFlagType(name, "float32", float32Conv) if err != nil { return 0, err } return val.(float32), nil } // Float32Var defines a float32 flag with specified name, default value, and usage string. // The argument p points to a float32 variable in which to store the value of the flag. func (f \*FlagSet) Float32Var(p \*float32, name string, value float32, usage string) { f.VarP(newFloat32Value(94e91d2d9
